

Evidence Document 3: Gigamon Project – Technical Leadership and UI Innovation

Candidate Name: Ramesh Swamynathan

Evidence Title: UI Innovation and Technical Leadership on GigaVUE-FM – Gigamon Fabric Manager

1. Overview

This document highlights my technical leadership, UI innovation, and collaborative engineering contributions to the GigaVUE-FM (Gigamon Fabric Manager) platform during my tenure at HCL Technologies. The GigaVUE-FM system is a comprehensive network fabric management solution used to manage visibility nodes across physical, virtual, and cloud environments, enabling traffic optimization and improved network monitoring.

2. About the Product: GigaVUE-FM

GigaVUE-FM is a web-based network traffic monitoring and management software that provides high-level visibility and control over Gigamon visibility nodes, including both H Series and G Series. The product supports operations like inline bypass, tunneling, traffic engineering, and alert monitoring, delivering unified visibility to IT and security teams across cloud, hybrid, and on-prem environments.

2. Role and Responsibilities

I contributed to the GigaVUE-FM product as a Technical Lead and Senior UI Developer, responsible for building scalable, modular, and responsive UI components across multiple modules in AngularJS. Key responsibilities included:

- Designed and developed new UI modules for Tunnel Port, Smart Load Balancing, SSL Services, SAPF, System Settings, Map Statistics, TACACS, RADIUS, LDAP, Image Server, and Audit Logs.
- Migrated legacy components from jQuery and Backbone.js to AngularJS, including performance tuning and integration.
- Created a **unified design system** (generic CSS, icons, layout components) to maintain a consistent look and feel.
- Introduced enhancements to the **dashboard**, supporting drag-and-drop widgets, status summaries, traffic stats, and logs.

- 1 - GigaVUE-FM Instance Name
- 2 - Profile Option (on the top navigation bar)
- 3 - Outlined Icons
- 4 - Rounded Buttons (for all GUI screens)

Figure 2: GigaVUE-FM Dashboard

- Delivered high-performance chart components using AngularJS with real-time visualization for events, logs, and traffic stats.
- Developed and tested **authentication screens** (TACACS+, RADIUS, LDAP) with user group mapping and validation.

Figure 10: Tunnel Ports UI

3. Innovations and Outcomes

- Spearheaded the migration to AngularJS, modernizing over 15+ legacy screens while reducing rendering time by 35%.
- Designed reusable directives and services to accelerate development velocity for new teams and features.

- Enhanced dashboard customizability with widget-based configuration, empowering users to personalize views.
- Reduced defect turnaround time by introducing generic error handling and validation framework.
- Played a pivotal role in releases: FM 2.2, 2.3, 3.0, 3.2, HD 4.4, and 4.5, consistently praised for UI stability and responsiveness.

4. Collaboration and Leadership

- Mentored a cross-functional team of developers during the Angular migration phase.
- Worked with backend teams to define RESTful API contracts, optimizing UI-to-backend communication.
- Supported QA teams with integration test cases and post-deployment validation.
- Actively collaborated with product owners and customers to gather requirements, reproduce UI issues, and support customization requests.

5. Conclusion

My work on the GigaVUE-FM project demonstrates technical leadership, modern front-end architecture, and UI innovation within a critical enterprise-grade network management platform. This evidence showcases my ability to deliver production-grade UI solutions with lasting impact across multiple releases.
